Research interests

I am broadly interested in the computational aspects of abelian varieties over global fields in the context of the Birch and Swinnerton-Dyer conjecture, as well as in local-global obstructions to rational points on varieties via cohomological gadgets such as the Brauer group. My PhD thesis will be on some explicit aspects of special values of L-functions of elliptic curves twisted by Dirichlet characters. Recently, I have been thinking of constructing databases of motives over global function fields, analogous to the LMFDB.

I am also interested in the formalisation of arithmetic geometry in interactive theorem provers, being a pioneer in the development of the theory of elliptic curves in Lean. Over the next few years, I will be formalising the proofs of fundamental arithmetic results, such as the Hasse–Weil bound and the Mordell–Weil theorem, culminating in the statements of major theorems and open conjectures.

Finally, I am passionate in pedagogical aspects of undergraduate mathematics education.
